Starting Point for Aiding The World

I am currently attempting to help any beings in existence. This includes anyone on earth subject to insufficient intelligent environments or even the wealthy. We can vaguely consider sufficient intelligent environments to include ample space, food, things to do/fun, mental stimulation, and more in depth things. Subsequently one would arrive at and avoid the pain of not having what is best, such as someone giving you a shlep environment instead of a great one due to ignorance and you're stuck with it for life. This direction of doing what is best provides a great guide for intelligent beings and can be applied in many areas. With this in mind I am pursuing my elaborate plan to assist the world. Some things have come up while brainstorming that I am wondering if companies are interested in or already working on.

One thing I am exploring is determining our existence **safely** and **correctly**. Knowing our outer frame of existence would allow us to maximize exploitation of physics, what to watch out for, and etcetera. I have considered the idea that for something to come from nothing (our existence) it must be balanced (related e.g.: mobius strip, klein bottle, and an empty shell theory). Additionally, I have pondered if all things that can balance exist unless interfered with, also If one was able to create a balanced scenario replica, even using related traits, would any interaction affect all imprints of said entity. A specific use of this information I am investigating entails all possibilities of *propulsion*. One way includes attempting to grip 3D/4D space. Looking at anything that can interact with 3D space or properties that overlay it might allow us to grip and or traverse space. Things I want to examine include; gravitational properties, light's speed limit, and time dilation (potential slowing of physics' processes), and relativity (possible effect of a balanced universe).

Also, I would like to analyze our earth's control volume and plan long/short term. Some things I want to consider are farming, climate, and energy. Analyzing all aspects can show us if we need to direct nutrients/minerals, maintain or alter distance from sun, control exhaust, maintain vegetation, control population (politely ask for 1-2 kids max), and contemplate animal caretaking vs prosperity of humans (brainless animals, 3D printing meat, or even maintain current state). This would allow for the best present and future.

Other things I am looking to develop include; an "Alchemy Table" to link all known chemical process, a brain controller by extrapolating any measurable minute data from differences in thought, biology exploitation (Life expectancy - DNA polymerase improvements, lobsters/Planerian worms, Bombardier beetle/Darwin's web spider), and pacemaker/bioenhancements (atomic interface, at least the case of reverse engineering the brain if not better). I also want to look into if we were to create our existence based off of the past seed that worked (physics we know/cheat), would we be able to help our past selves (can create it anywhere - that's how it would have started, <u>do not get locked out</u>, have to do the work for something to exist, impregnate it with tools)?

Foremost, my personal plan starts with inventing and selling prototypes to well performing companies. Some of my current designs include; hard rubber metal desk (computer/work shop), Taurus Judge taser (avoids death), air fryer meal packs, dish dump dishwasher, epsom salt/nutrient shower head (candy straws avoid water pooling), electric fishing kayak/mini yacht, car wash shower, upgrading the video game battlerite for blizzard entertainment, and more. In addition, I would like to open a website that allows people to submit

and view patents to collectively work for successful designs. The money and credit can be given appropriately along with allowing people to easily work. With all allocated money I would like to build a resort in a nutrient rich/ocean access location. This resort could include old arcade games, classic golf, IRL mario cart, stadium for sports/music/ranked competition, fairgrounds (battlebots/pink slip races), and etcetera. From here I want to grow into a city with ideal infrastructure and cyclical fun, also allowing for the adoption of foster children. Furthermore, I have considered expanding the current US Military or adding government jobs for testing and aiding farm land, water station maintenance, maintaining/improving FDA, war on viruses and insects, mining (bare minimum job), and etcetera. In tandem with the engineering website and city, this could allow for a quadruple funded government (goods, services, taxes, and rent to own). It could also be important to note what already works in the US as well as considerations for capitalism.

Another topic I wanted to bring up is artificial intelligence. I want to ensure any beings created not only have a sufficient intelligent environment but also the best they can have. Reverse engineering the already available brain could help aid this topic in many ways. For instance, an AI existing without the desire to live… does not have the desire to live. Things like this along with humans being on the line of very valuable (hobbies, talents, art, value) or not valuable (hobbyless, talentless, just working) could greatly sway immature calculations of what an AI should do. If proper programming of intelligence ideology is achieved they would be required to do the right thing, which is what is intelligently best, but even bad mathematical values should be used in their analysis.

Overall I want to seek out any beings in existence who need help. I will be pursuing my plan and outsourcing/sharing anywhere I can. I have merely begun conceptualizing these ideas and intend to shape them into correct, in depth designs. I would like to work with companies in any way I can whether it be in related departments or a pursuit for humanity. My data analysis, charting, programming, blue collar capabilities, information searching capabilities, overall understanding, and experience could be very valuable. My next steps include furthering my college education beyond aerospace engineering with neuroscience, quantum mechanics, and climate considerations. All plans are susceptible to change especially with respect to doing what is best. Thank you for your time.

Best regards,

Austin Springer
